How can i compare two excel spreadsheets for differences. How do i use index match between two excel spreadsheets. Excel spreadsheet index match. How to use index in excel between two sheets. Can you use index match across multiple sheets.

You just select your lookup column and your results column, and you're done. It appears frequently in spreadsheets, formulas, and even Excel interviews — so is a great formula to know for business analysts of any tenure. The MATCH function returns the position of a cell within an array by matching against a criteria string. That's a lot to digest, so let's take a look at an example to make things simpler. You can also use INDEX MATCH with wildcards to look up based on a partial phrase or string. You can lookup backwards. VLOOKUP only allows you to look up from columns that are in front of your starting point. So, how do we combine INDEX and MATCH to replace VLOOKUP? Let's say we want to look up how many Cookies were produced in March using the following table. Here's another example of MATCH used in a horizontal range: =MATCH("Brownies", B3:F3, 0)Output: 5 In this example, the formula outputs the number 5, because the value "Brownies" is found 5 spaces into the specified horizontal lookup range. However, INDEX MATCH still works well. Why INDEX MATCH is better than VLOOKUP After all this, you may be wondering why we even bother using INDEX MATCH. The formula looks like this: =MATCH(lookup value, lookup range, match type) Here's an example of MATCH in action: =MATCH("Cookies", B3:B5, 0)Output: 3 In this example, the formula outputs the number 3, because the value "Cookies" is found 3 spaces into the specified lookup range. Read on to find out how to use them together to activate one of the most powerful tools Excel has to offer. We'll start with an overview of the INDEX function. INDEX MATCH is so useful that many Excel pros use it to replace VLOOKUP entirely, never relying on the latter function. Take, for example, the following sheet: =INDEX(C3:C5, 3)Output: 9 In this example, the formula outputs the number 9, because the cell 3 spaces into the specified range contains the number 9. And, unlike VLOOKUP, it can be used on rows, columns, or both at the same time. Comments We feed the MATCH function into the row or column argument of the INDEX function like so: =INDEX(range, MATCH(lookup value, lookup range, match type)) Let's take a closer look at what's going on here. Let's use an INDEX MATCH to figure it out: =INDEX(B3:F3, MATCH(8, B4:F4, 0)Output: "Gummy worms" In this case, we're using the function on a horizontal range, and we're looking up something in a table header, rather than table data itself. In this case, this is the string "Sales (MM)". First, we call INDEX on a range of numbers from which we would like to look up a given value. Let's look at one more example, in which our range is a series of horizontal cells rather than vertical ones: =INDEX(B2:C2, 2)Output: "Sales (MM)" As you can see, INDEX works exactly the same way, counting the number of cells we specify in our row or column parameter and outputting what it finds at the end of its search. Take a look at our tutorial on wildcards in Excel for more information. Here's another example, in which we've changed the row or column parameter to 1: =INDEX(C3:C5, 1)Output: 15 In this example, the formula outputs the number 15, because the cell 1 space into the specified range contains the number 15. It looks to MATCH, which is called on the Month column. You can safely insert columns. Simply put, INDEX takes a cell range and returns a cell within that range based on a count provided by the user. That match type parameter is confusing, but really important to have in your formula. You can also use an INDEX MATCH MATCH to look up across both rows and columns, or use an INDEX MATCH with multiple criteria. The INDEX MATCH function is one of Excel's most powerful features. Let's try it again, this time with an example that will help demonstrate some of the more advanced functionality of INDEX MATCH. Isn't VLOOKUP just as good? The following spreadsheet shows SnackWorld production by month. More complex functionality. For now, always use a value of 0 for your match type. Then, we use MATCH to tell Excel how many cells it should count into INDEX's range, based on a given value matched against a separate array. How does Excel know how many cells to count down within the INDEX? Now you know how to use INDEX MATCH! When you're finished reading, be sure to check out our overview of how to use Excel for more useful tools. Plus, we'll reveal why you shouldn't use PivotTables and what to use instead... Let's say we know one category sold 8 million units, but we're not sure which one. Not so with INDEX MATCH — you can pull from any column you want to. How to create beautiful table formatting instantly... This time, we have a list of unit sales by category. Work smarter, not harder. With INDEX MATCH, there's no more worrying about counting to figure out which column you need to pull from. Here are a few reasons you might want to use INDEX MATCH instead: You don't have to count. Sign up for our 5-day mini-course to receive must-learn lessons on getting Excel to do your work for you. The older brother of the much-used VLOOKUP, INDEX MATCH allows you to look up values in a table based off of other rows and columns. This function may not seem particularly useful — and, used alone, it isn't — but when combined with MATCH, it becomes much more powerful. INDEX MATCH, on the other hand, safely updates no matter where you insert columns. MATCH finds the string given in the formula — "March" — three down on the list, so it pipes the number 3 back into the INDEX function, which counts down three cells and returns 37. Separate formulas. The formula looks like this: =INDEX(range, row or column) That may sound a bit complicated, but it's actually easy once you see it in action. Why? Why to rethink the way you do VLOOKUPs... We could do this easily using VLOOKUP, but let's try it with INDEX MATCH instead: =INDEX(C3:C7, MATCH("March", B3:B7, 0)Output: 37 In the example above, the formula outputs the number 37. Not quite. INDEX MATCH doesn't stop with the above tutorial. With VLOOKUP, if you insert a column in between the start of your table and the column you want to reference, your formula will break — the column index number within your VLOOKUP won't update. Now you don't need to remember separate formulas for VLOOKUP and HLOOKUP. Before we begin, it is important to realize that INDEX MATCH isn't actually a standalone function, but rather a combination of Excel's INDEX and MATCH functions. First, we perform an INDEX on the Cookies produced column.
